

Electric drum for adjusting length of retrieval line to selected wing span

If you change wing span, then you don't need to change or shorten the retrieval line.

Adjusting to the used wing span is possible by applying a single pin.

According to type of glider (e.g. 18/15m or 21/18m or 28/25m) length of retrieval line will be delivered for the bigger wing span.

Matching length to selected wing span: unwind retrieval line to wanted length, screw pin to drum as shown in the figures and wind up again.

By this simple action, the retrieval line will be adjusted to the selected wing span.

Details: see also installations manual added to delivery
